VIC Variable Infiltration Capacity
VOC Volatile organic compound
VPD Vapor pressure deficit
Acronyms, Glossary

The Effects of Climate Change on Agriculture, Land Resources, Water Resources, and Biodiversity

WS
Wind speed

WUE
Water use efficiency

Glossary

Anthesis
The period during which a flower is fully open and functional.

Boll
The seed-bearing capsule of certain plants, especially cotton and flax.

C3 species
Almost all plant life on Earth can be divided into two categories based on the way they assimilate carbon dioxide into their systems. During the first steps in CO2 assimilation, C3 plants form a pair of three carbon-atom molecules. C3 species continue to increase photosynthesis with rising CO2. C3 plants include more than 95 percent of the plant species on Earth.

C4 species
C4 plants initially form four carbon-atom molecules. C4 plants include such crop plants as sugar cane and corn. They are the second-most prevalent photosynthetic type, and do not assimilate CO2 as well as C3 plants.

Carbon sink
A carbon reservoir. Carbon sinks include the oceans, and plants and other organisms that remove carbon from the atmosphere via photosynthetic processes.

Carbon source
The term describing processes that add carbon dioxide to the atmosphere.

Carbon sequestration
The term describing processes that remove carbon dioxide from the atmosphere.

Climate
Climate in a narrow sense is usually defined as the “average weather” or more rigorously as the statistical description in terms of the mean and variability of relevant quantities over a period of time ranging from months to thousands or millions of years. The classical period is 30 years, as defined by the World Meteorological Organization (WMO). These relevant quantities are most often surface variables such as temperature, precipitation, and wind. Climate in a wider sense is the state, including a statistical description, of the climate system.

Climate Change
Climate change refers to a statistically significant variation in either the mean state of the climate or in its variability, persisting for an extended period (typically decades or longer). Climate change may be due to natural internal processes or external forcings, or to persistent anthropogenic changes in the composition of the atmosphere or in land use. Note that the United Nations Framework Convention on Climate Change (UNFCCC), in its Article 1, defines “climate change” as: “a change of climate which is attributed directly or indirectly to human activity that alters the composition of the global atmosphere and which is in addition to natural climate variability observed over comparable time periods.” The UNFCCC thus makes a distinction between “climate change” attributable to human activities altering the atmospheric composition, and “climate variability” attributable to natural causes. See also climate variability.
Climate Variability
Climate variability refers to variations in the mean state and other statistics (such as standard deviations, the occurrence of extremes, etc.) of the climate on all temporal and spatial scales beyond that of individual weather events. Variability may be due to natural internal processes within the climate system (internal variability), or to variations in natural or anthropogenic external forcing (external variability). See also climate change.

CO₂ enrichment
Addition of CO₂ to the atmosphere.

Coefficient of variation of annual runoff
A measure of the variability of runoff

Complementary hypothesis
This hypothesis states that trends in actual evaporation and pan evaporation should be in opposite directions.

Cucurbits
Any of various mostly climbing or trailing plants of the family Cucurbitaceae, which includes the squash, pumpkin, cucumber, gourd, watermelon, and cantaloupe.

Endophyte
A plant living within another plant, usually as a parasite.

Evaporation paradox
Temperature, precipitation, stream flow and cloud cover records indicate that warmer, rainier weather is now more common in many regions of the world. However, pan evaporation readings, taken at weather stations, indicate that less moisture has been rising back into the air from these pans.

Evapotranspiration
The sum of evaporation and plant transpiration. Evaporation accounts for the movement of water to the air from sources such as the soil, canopy interception, and water bodies. Transpiration accounts for the movement of water within a plant and the subsequent loss of water as vapor through stomata in its leaves.

Free-Air CO₂ Enrichment (FACE)
FACE is a method and infrastructure used to experimentally enrich the atmosphere enveloping portions of a terrestrial ecosystem with controlled amounts of carbon dioxide (and in some cases, other gases), without using chambers or walls.

Forb
A broad-leaved herb (not a grass), especially one growing in a field, prairie, or meadow.

Global dimming
The gradual reduction in the amount of global direct irradiance at the Earth's surface that was observed for several decades after the start of systematic measurements in 1950s.

Herbivores
Animals that feed chiefly on plants.

Homeostasis
The scientific study of periodic biological phenomena, such as flowering, breeding, and migration, in relation to climatic conditions.
Instream flow
The term used to identify a specific stream flow (typically measured in cubic feet per second, or cfs) at a specific location for a defined time, and typically following seasonal variations. Instream flows are usually defined as the stream flows needed to protect and preserve instream resources and values, such as fish, wildlife and recreation. Instream flows are most often described and established in a formal legal document, typically an adopted state rule.

Irrigation Modes
Drip irrigation allows water to drip slowly to the roots of plants through a network of valves, pipes, tubing, and emitters.
Flood irrigation pumps water onto the fields. The water then flows freely along the ground among the crops.
Spray irrigation relies on machinery to spray water in all directions.

Latent heat
The heat required to change the phase of a substance, for example a solid to vapor (sublimation), liquid to vapor (vaporization) or solid to liquid (melting); the temperature does not change during these processes. Heat is released for the reverse processes, for example vapor to solid (frost), liquid to solid (freezing), or vapor to liquid (condensation).

Leaf area index (LAI)
The ratio of total upper leaf surface of a crop divided by the surface area of the land on which the crop grows.

Lignin
An organic substance that, with cellulose, forms the chief part of woody tissue.

Lysimeter
A device for collecting water from the pore spaces of soils, and for determining the soluble constituents removed in the drainage.

Mutualistic relationship
A positive, reciprocal relationship between two species. Through this relationship, both species enhance their survival, growth or fitness.

Net primary productivity (NPP)
The ratio of all biomass accumulation and biomass losses in units of carbon, weight or energy, per land surface unit, over a set time interval (usually a year).

Pan evaporation
Pans used to determine the quantity of evaporation at a given location. These are generally located in agricultural areas, and have been used as an index to potential evaporation.

Panicle
The complete assembly of spikelets on a rice plant.

Phenology
The study of periodic biological phenomena (flowering of plants, breeding, and species migration) in relation to climatic conditions.

Potential Evapotranspiration
A representation of the environmental demand for evapotranspiration and represents the evapotranspiration rate of a short green crop, completely shading the ground, of uniform height and with adequate water status in the soil profile. It is a reflection of the energy available to evaporate water, and of the wind available to transport the water vapor from the ground up into the lower atmosphere.
Runoff ration
The total amount of runoff divided by the total moisture that falls during a precipitation event.

Ruminant
Even-toed, cud-chewing, hoofed mammals of the suborder Ruminantia, such as domestic cattle.

Sensible heat
Heat that can be measured by a thermometer.

Spikelet
The individual places on a rice plant where a grain develops.

Stomatal
One of the minute pores in the epidermis of a leaf or stem through which gases and water vapor pass.

Tiller
New shoots that develop at the base of the plant.
